

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously presented) A process for insulating electrical components comprising the steps of:
 - (a) providing one or more electrical components selected from the group consisting of transformers, components with windings, and conducting wires;
 - (b) applying a coat of polymerizable casting and impregnating composition and/or lacquer in flowable form to the surface of the components to impregnate the coat onto the components, wherein the impregnation step is achieved through immersion, flooding, vacuum impregnation, vacuum pressure impregnation or trickling; and
 - (c) curing the coated components to completion using near-infrared (NIR) radiation, said NIR radiation having a wavelength of from 500 nm to 1400 nm.
2. (Previously presented) The process as in claim 1,

wherein the NIR radiation has a wavelength of from 750 nm to 11 nm.

3. (Previously presented) The process as in claim 1, wherein the intensity maximum of the NIR radiation is situated within a wavelength range wherein the casting and impregnating composition of lacquer has an absorbance of between 20 and 80%.

4. (Previously presented) The process as in claim 1, wherein the NIR radiation is focused so that within the coat to be cured a temperature distribution adapted to the curing characteristics of said composition and/or lacquer is achieved.

5. (Previously presented) The process as in claim 1, wherein the coat is additionally cured by means of thermal heating with heated gases, by means of UV light and/or by means of electron beams.

6. (Previously presented) The process as in claim 1, wherein the components are impregnated at ambient temperature or in a preheated state or are heated during impregnation.

7. (Previously presented) The process as in claim 6,

wherein, following impregnation and before curing, the components are heated to the stage of partial gelling.

8-10. (Canceled)

11. (Previously presented) The process as in claim 1, wherein electrically conducting windings of the impregnated components are heated in the impregnating composition by applying current to an extent such that the desired amount of impregnation composition is gelled and fixed, in that after this gelling the component is removed from the impregnating composition, ungelled impregnating composition runs off and, if desired, is cooled and recycled, and in that the components are subsequently cured.

12-14. (Canceled)
